ANOVA Summary

Effect	df	ChiSq	p
Block	1	122.31	1.977×10^{-28}
congruency	1	37.14	1.099×10^{-9}
Block ✻ congruency	1	66.68	3.188×10^{-16}

Note. Generalized linear mixed model with binomial family and logit link function.

Note. Model terms tested with likelihood ratio tests testMethod.

Note. The following variable is used as a random effects grouping factor: 'caseid'.

Note. Type III Sum of Squares

Model summary

Fit statistics

Deviance	log Lik.	df	AIC	BIC
17366	−8747	5	17503	17543

Note. The model was fitted using maximum likelihood.

Sample sizes

	Levels of RE grouping factors
Observations	caseid
23112	36

Fixed Effects Estimates

Term	Estimate	SE	t	p
Intercept	2.026	0.075	27.188	9.002×10^{-163}
Block (1)	0.232	0.021	10.828	2.535×10^{-27}
congruency (1)	0.130	0.021	6.064	1.326×10^{-9}
Block (1) ✻ congruency (1)	0.174	0.021	8.107	5.173×10^{-16}

Note. The intercept corresponds to the (unweighted) grand mean; for each factor with k levels, k - 1 parameters are estimated with sum contrast coding. Consequently, the estimates cannot be directly mapped to factor levels. Use estimated marginal means for obtaining estimates for each factor level/design cell or their differences.

Variance/Correlation Estimates

caseid: Variance Estimates

Term	Std. Deviation	Variance
Intercept	0.427	0.182

Note. The intercept corresponds to the (unweighted) grand mean; for each factor with k levels, k - 1 parameters are estimated with sum contrast coding. Consequently, the estimates cannot be directly mapped to factor levels. Use estimated marginal means for obtaining estimates for each factor level/design cell or their differences.

Residual Variance Estimates

Std. Deviation	Variance
1.000	1.000
